

Three Reasons to get your COVID-19 Vaccine.

They're safe.

More than 640 million doses of COVID-19 vaccines have been given in the United States from December 2020 to November 2022. The vaccines were evaluated in thousands of people who volunteered to take part in clinical trials to test the vaccines. These volunteers included thousands of people from communities of color, including Black and Hispanic individuals who participated in the clinical trials. The vaccines continue to be monitored using both established and new monitoring systems.

They're effective.

The vaccines protect people from getting seriously ill, being hospitalized, and even dying. Getting a COVID-19 vaccine is a safer, more reliable way to build protection from getting sick with COVID-19. COVID-19 vaccination helps protect people by creating an antibody response without them having to experience potentially severe illness or long-term side effects.

They've changed.

The updated boosters are called "bivalent" because they protect against both the original virus that causes COVID-19 and the Omicron BA.4 and BA.5 variants. The previous "monovalent" boosters were designed to protect against the original virus that causes COVID-19. They do provide some protection against Omicron – just not as much as the updated boosters.

COVID-19 keeps changing. Make sure your protection changes with it. Get your bivalent booster today.
